

Learning Styles Reflection

Addison Fleming

After reading the article on different learning styles, I realize my preferred learning style is definitely visual or reading/writing. I have a hard time listening to a long lecture and retaining information, but if the lecture includes a power point with visuals/photos/graphs I tend to remember it better. That being said, flash cards have never really worked for me, and I always wondered why. It was refreshing to see that these common study/learning styles don't necessarily work for everyone, even if they are suggested by teachers/professors.

I resonated with the notion that overall, students learn more when they space out study sessions and experience the material in different forms. I have tried, many times, to study for a test in one go, for 3-4 hours, but all it does is burn my brain out. I have only recently in the past few years learned that separated study sessions are much more efficient, even if it doesn't feel like that at the moment. I found it interesting that the article mentioned that rewriting/copying notes isn't very useful for learning. For me, this method has worked pretty well, especially in lecture focused courses.
