

GUI vs. CLI MART-120
Creative Coding 1
Addison Fleming

Before this assignment, I had no idea what GUI and CLI meant. These are very new concepts to me. After doing some research on GUI and CLI, I've learned that these are basically two ways of using a computer. I normally use a GUI, letting me use things like buttons, windows, and folders. As far as I can remember, this is the only way I've used a computer.

A CLI is different because you are basically telling your computer what to do instead of clicking buttons. I read that it's easier to understand by comparing these two things to ordering food. At some places, you click what you want, how you want it cooked, etc. At other places you are telling the waitress/cook what you want and how. This comparison made it easier for me to understand these differences.

I think GUI (so far) is easier for me to comprehend, as I have little to no experience with CLI. I also think this is better for beginners in general. I learned that CLI can be very useful for coding because it lets you give the computer instructions. Overall, both are ways to communicate with a computer, but they do it in different ways. GUI uses visual tools, while CLI uses typed commands.
